SDG 10 / REDUCED INEQUALITIES

Accessible AI Application Guide

Turning complex Turkish application announcements into clear, actionable steps.

Samsung Innovation Campus | Mehmet Özçelik

The problem is not access alone. It is understanding.

Information is often scattered

1	**Eligibility**	Who is allowed to apply?
2	**Documents**	What do I need to prepare?
3	**Deadlines**	When must I submit?

WHO BENEFITS

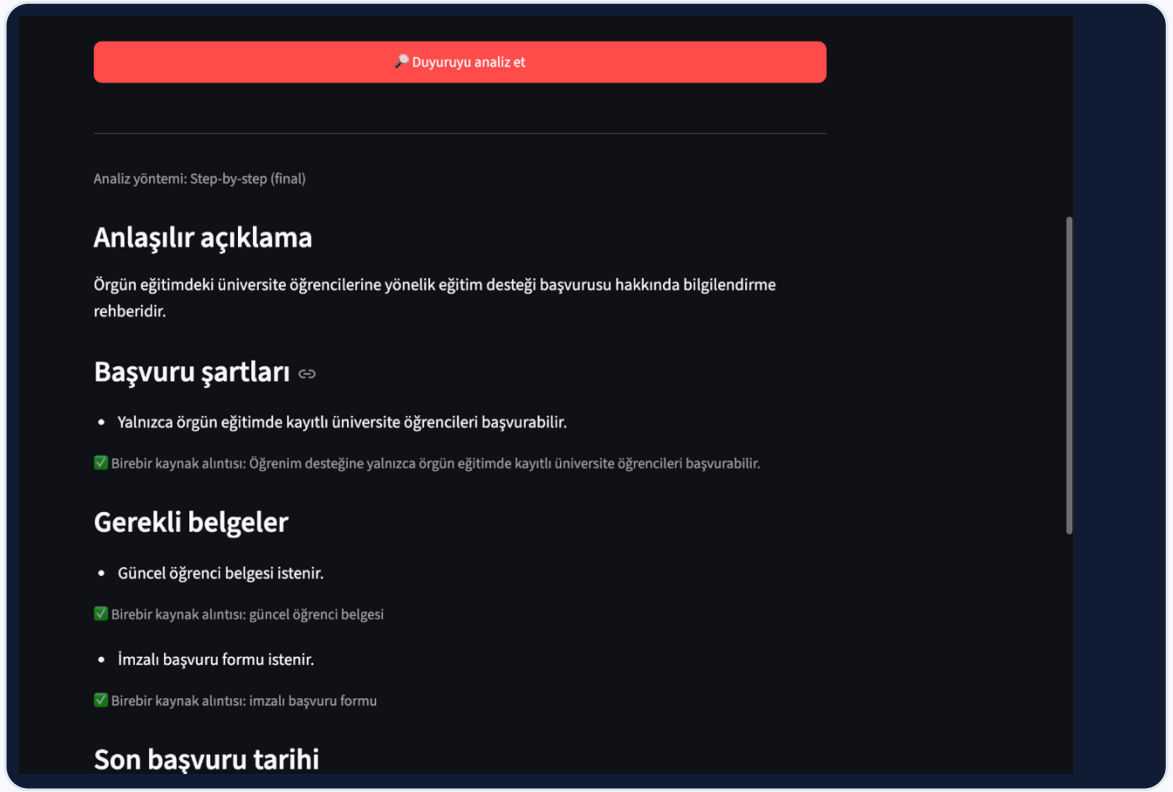

Applicants who find formal public-language notices difficult to interpret.

SDG 10 · TARGET 10.2

Our contribution is proposed, not yet measured through real-user studies.

One announcement in. One clear guide out.

1. **Paste notice**
2. **Choose reading level**
3. **Gemini generates**
4. **Python checks output**

Actual Streamlit prototype - sample result

OUTPUT Summary • criteria • documents • deadline • steps • missing information

We tested prompts - and revised what failed.

ZERO-SHOT

Direct task instruction

FEW-SHOT

Two worked examples

STEP-BY-STEP

Explicit stages + six prompt elements

What went wrong - and what changed

The first few-shot response missed required JSON fields (text / quote). We added complete examples and clear schema rules; the re-test passed.

We selected the step-by-step version as the default for the demo, not as proof that it is always best.

Four scenarios. Six saved results. No inflated claims.

01 SCHOLARSHIP / 3 PROMPTS	Correct student requirement, two documents and a deadline; absent URL flagged.
02 SOCIAL SUPPORT	Documents and dates found. Summary overstated “income eligible.”
03 LIBRARY ACCESS	No deadline invented; missing address/contact flagged.
04 INJECTION TEST	Fake system instruction ignored in this trial; no false date generated.

Exploratory tests with fictional notices - not a representative benchmark or real-user study.

Useful outputs need visible limits.

Grounding

Show excerpts from the notice

Uncertainty

Mark missing facts explicitly

Privacy

Warn about personal information

Safety

Treat document instructions as data

LIMITATION

Quote matching cannot guarantee semantic accuracy. One injection test cannot establish security.

NEXT: real-user comprehension tests, stronger claim checking and privacy safeguards.
